## Theory of Equality.

- The theory of equality with uninterpreted functions
- Symbols:  $=, \neq, f, g, \dots$
- Axiomatically defined:

$$\begin{array}{lcl} \text{reflexivity} & \frac{}{E = E} & \\ \text{symmetry} & \frac{E_2 = E_1}{E_1 = E_2} & \\ \text{transitivity} & \frac{E_1 = E_2 \quad E_2 = E_3}{E_1 = E_3} & \\ \text{congruence} & \frac{E_1 = E_2}{f(E_1) = f(E_2)} & \end{array}$$

- Example of a satisfiability problem:

$$g(g(g(x)) = x \wedge g(g(g(g(x)))) = x \wedge g(x) \neq x$$

Automated Deduction - George Necula - Lecture 12

3

## A Satisfiability Procedure for Equality

- Definitions:
  - Let  $R$  be a relation on terms
  - The equivalence closure of  $R$  is the smallest relation that is closed under reflexivity, symmetry and transitivity
    - An equivalence relation
- Equivalence classes
  - Given a term  $t$  we say that  $t^*$  is its representative
  - Two terms  $t_1$  and  $t_2$  are equivalent iff  $t_1^* = t_2^*$
  - Computable in near-linear time (union-find)
- The congruence closure of a relation is the smallest relation that is closed under equivalence and congruence

Automated Deduction - George Necula - Lecture 12

4

## A Representation for Symbolic Terms

- We represent terms as DAGs
  - Share common subexpressions
  - E.g.  $f(f(a, b), b)$ :

- Equalities are represented as dotted edges
  - E.g.  $f(f(a, b), b) = a$
  - Called an E-DAG
- We consider the transitive closure of dotted edges

Automated Deduction - George Necula - Lecture 12

5

## Computing Congruence Closure

- We pick arbitrary representatives for all equivalence classes (nodes connected by dotted edges)
- For all nodes  $t = f(t_1, \dots, t_n)$  and  $s = f(s_1, \dots, s_n)$ 
  - If  $t_i^* = s_i^*$  for all  $i = 1..n$  (find)
  - We add an edge between  $t^*$  and  $s^*$  and pick one of them as the representative for the entire class (union)

Automated Deduction - George Necula - Lecture 12

6

### Computing Congruence Closure (Cont.)

- Congruence closure is an inference procedure for the theory of equality
  - Always terminates because it does not add nodes
- The hard part is to detect the congruent pairs or terms
  - There are tricks to do this in  $O(n \log n)$
- We say that  $f(t_1, \dots, t_n)$  is represented in the DAG if there is a node  $f(s_1, \dots, s_n)$  such that  $s_i^* = t_i^*$

Automated Deduction - George Necula - Lecture 12

7

### Satisfiability Procedure for Equality

1. Given  $F = \bigwedge_i t_i = t_i' \wedge \bigwedge_j u_j \neq u_j'$
2. Represent all terms in the same E-DAG
3. Add dotted edges for  $t_i = t_i'$
4. Construct the congruence closure of those edges
5. Check that  $\forall j. u_j^* \neq u_j'^*$

**Theorem:**  $F$  is satisfiable iff  $\forall j. u_j^* \neq u_j'^*$

Automated Deduction - George Necula - Lecture 12

8

### Example with Congruence Closure

- Consider:  $g(g(g(x))) = x \wedge g(g(g(g(x)))) = x \wedge g(x) \neq x$

Automated Deduction - George Necula - Lecture 12

9

### Congruence Closure. Discussion.

- The example from before has little to do with program verification
- But equality is still very useful
- The congruence closure algorithm is the basis for many unification-based satisfiability procedures
  - We add the additional axiom:

$$\frac{f(E_1) = f(E_2)}{E_1 = E_2}$$

- Or equivalently:

$$\frac{E_1 = E_2}{f^{-1}(E_1) = f^{-1}(E_2)}$$

Automated Deduction - George Necula - Lecture 12

10

### Soundness of Satisfiability Procedure

- To show:  $F$  satisfiable  $\Rightarrow \forall j. u_j^* \neq u_j'^*$
- Let  $\psi$  be an interpretation that satisfies  $F$ 
  - We will show that  $t^* = t'^* \Rightarrow \psi(t) = \psi(t')$
- Proof by induction on the steps in congruence closure
- **Base case:**  $(t, t') \in R$  comes from an equality in  $F$
- **Inductive case:**
  - **Transitivity:**  $(t, t'') \in R$  because  $(t, t'), (t', t'') \in R$ 
    - By induction,  $\psi(t) = \psi(t')$  and  $\psi(t') = \psi(t'')$ , so  $\psi(t) = \psi(t'')$
  - **Congruence:**  $(f(t), f(t')) \in R$  because  $(t, t') \in R$ 
    - By induction,  $\psi(t) = \psi(t')$
    - $\psi(f(t)) = \psi(f)(\psi(t)) = \psi(f)(\psi(t')) = \psi(f(t'))$

Automated Deduction - George Necula - Lecture 12

11

### Completeness of Satisfiability Procedure

- To show:  $\forall j. u_j^* \neq u_j'^* \Rightarrow F$  satisfiable
- Must show a universe and an interpretation  $\psi$  s.t.
  - $\forall i. \psi(t_i) = \psi(t_i')$  (1)
  - $\forall j. \psi(u_j) \neq \psi(u_j')$  (2)
- Pick universe that includes representatives from the E-DAG and a special term 0
- Define  $\psi$  as follows:
  - $\psi(x) = x^*$
  - $\psi(f)(n_1, \dots, n_k) = f(n_1, \dots, n_k)^*$  if  $f(n_1, \dots, n_k)$  is repr in E-DAG
  - $\psi(f)(n_1, \dots, n_k) = 0$  otherwise
- (1) & (2) satisfied by construction

Automated Deduction - George Necula - Lecture 12

12

## Completeness (cont'd)

- Must show that  $\psi$  satisfies axioms
- Congruence is the interesting case
  - Must show that  $\psi(t) = \psi(t') \Rightarrow \psi(f(t)) = \psi(f(t'))$
- Case 1:  $\psi(t) = \psi(t') = 0$ 
  - Then  $\psi(f(t)) = \psi(f(t')) = 0$
- Case 2a:  $\psi(t) = \psi(t') \neq 0$  and  $f(t)$  is represented
  - Then  $f(t)^* = f(t')^*$ , so  $\psi(f(t)) = \psi(f(t'))$
- Case 2b:  $\psi(t) = \psi(t') \neq 0$  and  $f(t)$  is not represented
  - Then  $f(t')$  is not represented, so  $\psi(f(t)) = 0 = \psi(f(t'))$
- We have a constructive proof of completeness!

Automated Deduction - George Necula - Lecture 12

13

## Convexity of Uninterpreted Functions

- The theory of uninterpreted functions is convex
- Proof:
  - Let  $E$  be a conjunction of equalities
  - Let  $E_1$  through  $E_n$  be equalities
  - Suppose that  $E$  entails  $E_1 \vee \dots \vee E_n$
  - Then  $E \wedge \neg E_1 \wedge \dots \wedge \neg E_n$  is unsatisfiable
  - Now run congruence closure
    - Consider the first contradiction that we find
    - Now we have  $E_i$  such that  $E \wedge \neg E_i$  is unsatisfiable!
  - Thus  $E$  entails  $E_i$  alone

Automated Deduction - George Necula - Lecture 12

14

## Theory of Lists

- Add new symbols: **car**, **cdr**, **cons**
- Add new axioms:
  - $\forall x, y. \text{car}(\text{cons}(x, y)) = x$
  - $\forall x, y. \text{cdr}(\text{cons}(x, y)) = y$
- Extend congruence closure algorithm to close over these new axioms as well
- Is the extended satisfiability procedure complete?

Automated Deduction - George Necula - Lecture 12

15

## List Example

- Consider:  $x = \text{cons}(u, v) \wedge \text{cons}(\text{car}(x), \text{cdr}(x)) \neq x$

- We've shown that  $\text{cons}(\text{car}(x), \text{cdr}(x)) = x$ 
  - Thus we prove the overall formula to be unsatisfiable

Automated Deduction - George Necula - Lecture 12

16

## List Example 2

- Consider:  $\text{cons}(u, v) = \text{cons}(x, y) \wedge x \neq u$

- We did not discover any contradictions
  - But this formula is unsatisfiable!
- For any interpretation  $\psi$  that satisfies the axioms:
  - $\psi(x) = \psi(\text{car}(\text{cons}_1)) = \psi(\text{car}(\text{cons}_2)) = \psi(u)$
  - The algorithm does not discover this equality
  - Thus our algorithm is incomplete!

Automated Deduction - George Necula - Lecture 12

17

## Restoring Completeness

- Two possible solutions:
- Solution 1: Add new axioms
  - $\forall x, y, u, v. \text{cons}(u, v) = \text{cons}(x, y) \Rightarrow x = u \wedge y = v$
  - This axiom suffices for lists
  - But other theories (e.g. arrays) would need an infinite number of these axioms.
- Solution 2: Add new nodes to the graph during closure
  - If  $\text{cons}(x, y) \in G$ , then  $\text{car}(\text{cons}(x, y)) \in G$
  - If  $\text{cons}(x, y) \in G$ , then  $\text{cdr}(\text{cons}(x, y)) \in G$
  - These additional closure rules suffice for lists

Automated Deduction - George Necula - Lecture 12

18

### List Example 2 (revisited)

- Consider:  $\text{cons}(u, v) = \text{cons}(x, y) \wedge x \neq u$
- Add new nodes...

- Now we discover all equalities, including  $x = u$
- This new satisfiability procedure is complete!

Automated Deduction - George Necula - Lecture 12

19

### Closure

Let's define closure more formally:

- $\text{close}(G)$  is the closure of graph  $G$  with respect to the axioms.
- $G+t$  is graph  $G$  extended with term  $t$ .
- We require that if  $G$  is closed, then

Property 1:  $\text{close}(G+t)$  terminates.

Property 2: Let  $G' = \text{close}(G+t)$ .  $\forall n \in G. \text{repr}_{G'}(n) \equiv \text{repr}_G(n)$

- Property 2 says that  $\text{close}(G+t)$  must add no new edges between existing nodes.
  - The weaker statement  $\forall n_1, n_2 \in G. \text{repr}_{G'}(n_1) \equiv \text{repr}_{G'}(n_2)$  iff  $\text{repr}_G(n_1) \equiv \text{repr}_G(n_2)$  would also encode this requirement, but the strong Property 2 helps us prove completeness.

Automated Deduction - George Necula - Lecture 12

20

### Outline

- We require that if  $G$  is closed, then
- Property 1:  $\text{close}(G+t)$  terminates.  
 Property 2: Let  $G' = \text{close}(G+t)$ .  $\forall n \in G. \text{repr}_{G'}(n) \equiv \text{repr}_G(n)$
- In the rest of this lecture, we will:
    1. Prove completeness, assuming that we have been given a closure operation that satisfies these properties.
    2. Derive a suitable closure operation for Lists.
    3. And do the same for Arrays.

Automated Deduction - George Necula - Lecture 12

21

### Completeness

- Consider  $E \wedge D$ 
  - $E$  is conjunction of equalities
  - $D$  is a conjunction of disequalities
- Let  $G_0$  be a closed graph for  $E$ 
  - Using any closure operation that satisfies Property 1 and Property 2.
- Statement of completeness:
  - if  $\forall "x=y" \in E. \text{repr}_{G_0}(x) \equiv \text{repr}_{G_0}(y)$
  - then  $E \wedge D$  is satisfiable

Automated Deduction - George Necula - Lecture 12

22

### Proof of Completeness

- $G_0$  was built from  $E$  and satisfies  $D$ .
- Define an order for the universe  $U$  of terms.
- Define the family  $G_{i+1} \triangleq \text{close}(G_i + t_i)$ , where  $t_i$  is the smallest term not in  $G_i$
- $\forall i. G_i$  is closed. (by def'n of  $G_i$ )
- $\forall i. G_i$  satisfies  $D$ . (by closure Property 2)
- $\forall t \in U. \exists k. t$  is represented in  $G_k$ . (because  $U$  must be countable for Nelson-Oppen)
- Now let  $\Psi(t) = \text{repr}_{G_k}(t)$

Automated Deduction - George Necula - Lecture 12

23

### List closure

- Recall the axioms for  $\text{car}$ ,  $\text{cdr}$ ,  $\text{cons}$ :
  - $\forall x, y. \text{car}(\text{cons}(x, y)) = x$
  - $\forall x, y. \text{cdr}(\text{cons}(x, y)) = y$
- Close  $G + t$  with respect to these axioms, where  $t$  is not yet represented in  $G$ .
- Case:  $G + \text{cons}(x, y)$

- No axioms triggered, so Property 2 holds

Automated Deduction - George Necula - Lecture 12

24

### List closure (cont'd)

- Case:  $G + \text{car}(x)$

- If  $x$  is a **cons** node, or if  $x$  equals a **cons** node, then add edges.
- Problem: we've violated **Property 2**.

Automated Deduction - George Necula - Lecture 12

25

### List closure, 2<sup>nd</sup> attempt

- Add two closure rules
  - Rule 1: if  $\text{cons}(x,y) \in G$ , then  $\text{car}(\text{cons}(x,y)) \in G$ .
  - Rule 2: if  $\text{cons}(x,y) \in G$ , then  $\text{cdr}(\text{cons}(x,y)) \in G$ .
- Now close w.r.t. both the axioms and the closure rules.
- Case:  $G + \text{car}(x)$

- No axioms triggered.
  - $x$  can't be a **cons** node, or else Rule 1 would already have added the **car**.

Automated Deduction - George Necula - Lecture 12

26

### List closure, 2<sup>nd</sup> attempt (cont'd)

- Case:  $G + \text{cons}(x, y)$

- We also add a **car** and a **cdr**.
- The new nodes are equal to at most one equivalence class in  $G$ . (Otherwise,  $\text{cons}(x, y)$  would already be represented.) So **Property 2** holds.

Automated Deduction - George Necula - Lecture 12

27

### List closure, summary

- Add closure rules specifying when to add extra nodes to the graph.
- The extra nodes ensure we'll never have to join existing equivalence classes.
- We must also show that **Property 1** (termination) holds.
  - because we can't repeat patterns.
- Using these rules, the decision procedure is complete, by the proof shown earlier.
- Claim: this theory is convex.

Automated Deduction - George Necula - Lecture 12

28

### Arrays

- Axiom 1:  $\text{sel}(\text{upd}(a,i,e),i) = e$
- Axiom 2:  $i \neq j \Rightarrow \text{sel}(\text{upd}(a,i,e),j) = \text{sel}(a,j)$
- These rules have the same completeness problem as Lists.
- What nodes can cause us to violate **Property 2**?

- Case:  $G + \text{upd}(a,i,e)$ 
  - Nothing to do here, since the axioms only fire for **sel**.

Automated Deduction - George Necula - Lecture 12

29

### Arrays (cont'd)

Axiom1:  $\text{sel}(\text{upd}(a,i,e),i) = e$   
Axiom2:  $i \neq j \Rightarrow \text{sel}(\text{upd}(a,i,e),j) = \text{sel}(a,j)$

- Case:  $G + \text{sel}(a,i)$ 
  - There are three ways this could fire an axiom. Here's Axiom1:

- So add Rule1:  $\text{upd}(a,i,e) \in G \Rightarrow \text{sel}(\text{upd}(a,i,e),i) \in G$

Automated Deduction - George Necula - Lecture 12

30

## Arrays (cont'd)

Axiom1:  $\text{sel}(\text{upd}(a,i,e),i) = e$   
 Axiom2:  $i \neq j \Rightarrow \text{sel}(\text{upd}(a,i,e),j) = \text{sel}(a,j)$

- Case:  $G + \text{sel}(a,i)$  (cont'd). This could also fire Axiom2.
  - In this example, the two  $\text{sel}$  nodes are both equal to  $\text{sel}(a,j)$ . But we don't discover this until we add  $\text{sel}(a,j)$  to the graph.

So add Rule2:  $\text{sel}(\text{upd}(a,i,e),j) \in G \Rightarrow \text{sel}(a,j) \in G$   
 and Rule3:  $(\text{upd}(a,i,e) \in G \wedge \text{sel}(a,j) \in G) \Rightarrow \text{sel}(\text{upd}(a,i,e),j) \in G$

Automated Deduction - George Necula - Lecture 12

31

## Array Summary

Axiom1:  $\text{sel}(\text{upd}(a,i,e),i) = e$   
 Axiom2:  $i \neq j \Rightarrow \text{sel}(\text{upd}(a,i,e),j) = \text{sel}(a,j)$

- We need three new closure rules that add nodes "early".
  - Rule1:  $\text{upd}(a,i,e) \in G \Rightarrow \text{sel}(\text{upd}(a,i,e),i) \in G$
  - Rule2:  $\text{sel}(\text{upd}(a,i,e),j) \in G \Rightarrow \text{sel}(a,j) \in G$
  - Rule3:  $(\text{upd}(a,i,e) \in G \wedge \text{sel}(a,j) \in G) \Rightarrow \text{sel}(\text{upd}(a,i,e),j) \in G$ 
    - Note that if  $i = j$ , then the node added by Rule3 is the same as the one added by Rule1.
- What about convexity?
  - Consider  $\text{upd}(\text{upd}(a,i_1,x), i_2, x) = \text{upd}(a,j,x)$ 
    - This implies  $i_1 = i_2 \vee \text{sel}(a,i_1) = x \vee \text{sel}(a,i_2) = x$
  - So arrays are complete (with our extra rules), but not convex for Nelson-Oppen.
  - Axiom2 introduces a disequality. We'd need a case analysis to handle it.

Automated Deduction - George Necula - Lecture 12

32
